Product Name: Spotify Match

Team Name: Team Rocket

Vani Agrawal, Amaan Sheikh, Amandeep Singh, Mrinmoyee Mishra, Rami Wilson, Calder
Wilson

List of functions not working correctly:

- The logout button doesn't have complete functionality because it cannot switch between
  multiple users. There is no way to delete a token unless the user deletes the account,
  because the Spotify API has not implemented a feature of deleting the token. It is
  something that they have taken into consideration. For now, the logout button navigates
  the user to the login page, but the user will not be able to switch their account. ANd if
  they hit login again, they will just be taken back to the homepage with their previously
  signed in account.

- The edit profile and the survey page throw a console error onto the screen when you try
  to change the date. This is because the store.js file that we have our program takes in
  strings and not non-serializable data.

- The render page test in the render.test.js file passes the test, however it does display
  many errors. This is potentially due to the Login Screen requiring an authentication
  process.

- The matches page has a bug at times because we could not load the images into the
  backend for the fake users we created. As a result, it may not display the matches
  correctly in some cases.

- The first user on the home screen does not render. But once we swipe through every
  other user works.

- Swiping left sometimes takes the user back to the survey page. The reason is unknown
  but does not interfere with the usage of the app. This problem also shows up in other
  pages.

- When you reload the application and are taken back to the Home Screen sometimes the Home Screen does not display any user cards.

- The unit tests all pass but do throw a lot small errors in the console log but are functional.

- Even after manually fixing a lot of npm dependency issues/warnings and using dependabot on GitHub, we still have some packages whose versions are outdated and not compatible with some other required packages. These npm dependency issues are causing vulnerabilities issues.

- There are console warnings in most of the pages in the app
